Beams

Created by:

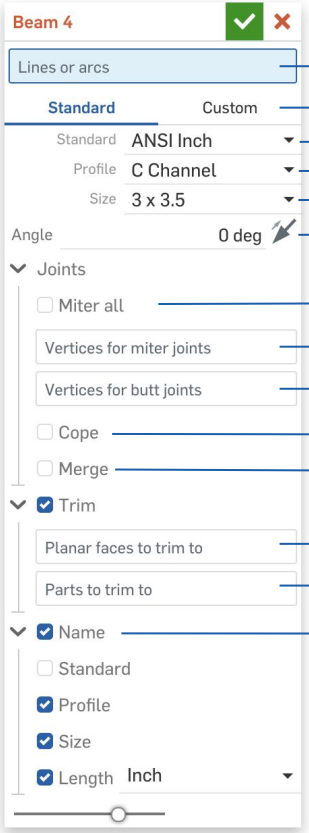
Neil Cooke, Onshape Inc.

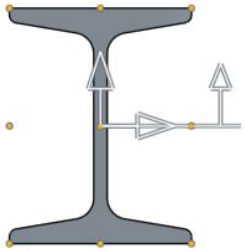
Description:

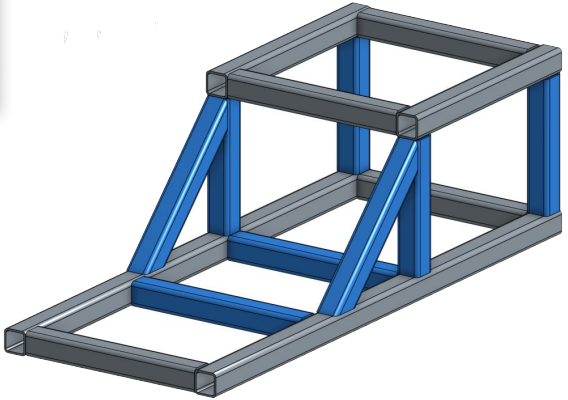
This custom feature creates structural steel frames.

Prerequisites:

Lines or arcs from sketches or solid/surface bodies.

Notes:






1. The first selected beam has 3 manipulators, two for repositioning the origin of the profile and one for rotating the profile. The position and orientation of the first beam determines the location of all other beams in the feature. Each profile has 9 origin points as shown in the image to the right.
2. Beams that intersect other beams at a location other than a 2 edge corner (blue beams in image) must be made in a separate beam feature. Use the Trim beams option to define the extents of these beams. Planar face trims cannot have coped ends.
3. To use your own custom profiles, there is no need to make a copy of this feature. Use the “Custom” option to select a sketched profile from another Document. These profiles must be sketched on the Top Plane with the Origin as the profile insertion point.
4. If you want to add your own profiles to the list of Standard profiles, use the Beam Profile feature to add them to the LookUpTable in the Beam Profiles tab. Use the “Custom” option where possible.
